**COVID-19 with Ivermectin (Ivermectin)**

Ivermectin, an anthelmintic agent that is effective against various helminthic and some arthropod parasites, has been extensively studied for its potential role in the treatment and prophylaxis of COVID-19. Recent clinical trials have shown promising results in reducing the duration of viral shedding and symptom resolution in infected patients. This review highlights the key aspects of Ivermectin's role in COVID-19 management.

1. **Ivermectin** is indicated for the treatment of: 
   - **Hyperviscosity Syndromes**
   - **Leishmaniasis**
   - **Strongyloidiasis**
   - **Onchocerciasis**
   - **Strongyloides**
   - **Larval Echinococcosis**
   - **Cutaneous Larva Migrans**
   - **Trichinella**
   - **Strongyloides Stercoralis**

2. **Ivermectin** is contraindicated for: 
   - **Patients with severe renal or hepatic impairment**
   - **Pregnant women**
   - **Breastfeeding mothers**

3. **Ivermectin** should be used with caution in: 
   - **Patients with severe autoimmune diseases**
   - **Patients with seizures**
