

## Ivermectin healed my family my teen was exposed

I'm a nurse anesthetist and caught covid from my teenager. who went to a church camp. She had forgotten to take ivermectin which I sent with her for prevention. When I picked her up she told me she had a scratchy throat and sinus drainage. I made her take 12 mg of Ivermectin and some vit D and C.

On Sunday, we heard that a camper tested positive for Covid. Immediately, I gave ivermectin doses to my whole family. Because of that one positive case, I double masked at work all week with my N95 and stayed out of the lunch room. (No one at work caught it from me). I started taking 10,000 units of Vit D that week and some Vit C. I thought I was immune, because I took ivermectin. I took 2 additional doses ivermectin at 12 mg. I continued to get sicker and had to go to the ER. a week later because my oxygenation worsened.. I received steroids in the ER but the doctor did not believe in ivermectin.

After I went home, I started the treatments. and I added melatonin and aspirin. My oxygen immediately came up to 96-97%. It took me 3 weeks to feel 100%. I'm so grateful that I had gotten Ivermectin and HCQ before I needed it. I realized that I should've taken a higher dose of Ivermectin and every day. after seeing the protocol updates.

One of the moms of the teens at camp crashed really fast. She went to the local hospital where they gave her oxygen and some steroids. She was there for a month. And, is now home on O2 and still coughing. She told me that she tested positive for delta. My husband and teenager were barely affected. My husband followed the same protocol. My teen lost her smell for awhile, but was always full of energy.

When we learned about the other recommended mouthwash, we did that, too. We are all fine and 100% recovered. Thank you for all the work you do!
