

## Travel nurse who has seen ivermectin save many lives

I am a PICU RN with 44 years experience as a bedside nurse. For 38 years, I was a staff nurse in the Pediatric ICU at a Level One trauma center. 11 days ago, my 67-year-old husband (who has multiple co-morbidities) woke me and told me that he had developed vomiting, diarrhea, achy joints and general malaise over a few hours and was feeling very weak.

His symptoms progressed to chills, fever and low O2 saturation in the low 90s. I took him to a local urgent care for a COVID test and while he was there, he became very sleepy and his oxygen saturation was in the high 80s. We were advised to go to the nearest emergency room. His rapid COVID test and his RT-PCR were both negative. Instead, of going to the ER, I took him home and immediately called one of the doctors whose number I had written down that would provide early treatment. By that evening, he received his first dose of HCQ, Ivermectin, Prednisone, Eliquis, Colchicine, nutraceuticals and oxygen at 8 liters per minute via face mask. He was greatly improved within the next 48-72 hours, but we continued to follow the protocol and self-quarantine.

He is a retired respiratory therapist, so at night he connected his CPAP machine to his oxygen concentrator. My son and I also used ivermectin as prophylaxis. We also added short walks during the second half of the quarantine as well as mouth rinses with Scope. Today, he is completely off quarantine and says he feels quite good. I never doubted the information that I have been reading and following from these amazing physicians, but it was very powerful to watch it unfold before my very eyes. My whole family and I are immensely grateful.

- Mary, RN, Georgia
