

Ivermectin saves my patients and prevents infections.

I am a clinical resource nurse responsible for the care of over 5 thousand indigenous people in South America.

I have effectively treated all of the indigenous patients that came with Covid symptoms with a single dose of Ivermectin.

The indigenous population there is living in clusters of large groups and they visit each other's hut homes frequently.

This treatment with Ivermectin was initiated a year ago (2020) by the indigenous hospitals and has continued on ever since the beginning of the pandemic. None of the patients have passed away from Covid - 19.

On the other hand, the other non-indigenous population in that area has lots of cases of Covid - 19 at this time and, the main local hospital is not using Ivermectin to treat their patients unlike the indigenous clinics/hospitals are. The main local hospital is following orders of the WHO and is dealing with a significant number of patients that have to be admitted suffering side effects from the Covid vaccines they received, or from Covid-19 infections themselves. A number of the non-indigenous people have passed away from Covid - 19 at the main local hospital.
