Abstract

Controversy over a reported increase in office visits specifically scheduled for illnesses and conditions in children has stalled progress in understanding adverse outcomes associated with an increasingly crowded schedule of pediatric vaccines. Studies finding associations between vaccines and adverse conditions have been targeted for retraction. Here, we revisit data from one such study, comparing the increase in office visits for conditions independent of the routine “well-child” visits (hereafter, Health Care Visits; HCVs). The retraction occurred after >1/4 of a million people had read the peer-reviewed study. It was targeted by one anonymous reader who complained he did not believe the published results. His complaint hinged on the supposition — unsupported by any data — that vaccinated children made their scheduled HCVs more regularly than unvaccinated, implying that those unkept appointments led to fewer diagnoses. We show, here, new data from the same practice that the opposite is true. When the data for vaccinated versus unvaccinated children are examined, the critic’s claim is exactly reversed. Relative Risk and Odds Ratios sustain and augment the original report. Additional office visits, beyond scheduled HCVs, are quantified, controlling for

**Children who stopped vaccinating had half the poor health
outcomes of those who continued to vaccinate.**

Vaccinations = INFANT DEATHS

**Between 1990 and 2019,
2,605 infant deaths were reported
in VAERS, 78.3% of these deaths
occurring within a week of vaccination!**

- Torch 1982b + Baraff 1983c DPT
- Torch 1986d DPT
- Soldatenkova 2007e Hepatitis B
- GSK 2011/15f Infanrix Hexa
- Miller 2021 (All Deaths) Any
- Miller 2021 (SIDS) Any

HEALTH OR SICKNESS?

“If you do what everyone else does, you get what everyone else gets.”

Paul Thomas MD

The time has come to reject all vaccines until each is properly tested alone and In combination with others.
